Introduction to the Editor application

WinOS Framework Studio, or **WinOS-Editor**, is an *application for the creation of **WinOS system frameworks** and **APIs**.* It uses *low level functions from the WinOS System*. It cannot be considered as the *'Unity Editor' of WinOS*, but more like the *'Visual Studio' of WinOS*.

Frameworks

Frameworks are native pieces of code which get loaded by WinOS on boot.

- They can have **multiple subclasses**, for example,

  WinOS.Graphics.DrawSquare(1, x, y);

- One framework can *use the functions / classes* of **another framework / class**, for example,

  WinOS.UI.DrawButton();

  can use

  WinOS.Graphics.DrawRectangle();

NB: **The framework WinOS is independent, maybe using AJXS for common functions, because it is the OS itself.**

*Frameworks are compiled as **.wdll**s and placed into the ESP.*

E.g. **ESP/FRAMEWORKS/WinOS.wdll**

Features of the Editor application

- **UI : Code area** for individual scripts
- **UI : Framework metadata**;
  Name:
  Version:
  Requires: *(auto filled by Editor based on the external frameworks used)*

- **UI : Class hierarchy**; Shows **all classes / namespaces in the current framework** as *tree view*
- **UI : Error Panel**; Shows **current errors** in scripts, *just like VS*
- **Fn : Build system** that *builds the framework to readable .wdlls* for *kernel launch*
- **Fn :** Add other frameworks as dependencies for current

- **Fn : Save code *(Dev side)* as .cpp files** (kernel is in cpp, making it easier ig). The used programming language is **C++**, and maybe **Assembly** for *low level functions*
- **Fn : Save metadata of framework (Dev side)** with the **Framework metadata** and **Class structure** *with associated files* as **.wdfp** (WinDroid Framework Project), which is *openable via the Editor*, like **.csproj for Visual Studio**.
